Overview

The National Study of Caregiving (NSOC) asks caregivers to report their total income (and their spouses' or partners' income if the caregiver is married or lives with a partner) for the prior calendar year. For those who do not know the exact value, information is collected in broad categories. Spouses of NHATS participants skip these questions, but have their income collected or imputed in NHATS [see DeMatteis, Freedman, Kasper (2012; 2015; 2016; 2018) for details].

After bringing over information from NHATS for spouses, exact income values are available for about three-fourths of participants. In order to facilitate use of the income data by researchers, we have developed a set of imputed values for those with missing or categorical income information. We provide five sets of imputed values to enable data users to use multiple imputation variance estimators and analysis techniques (see, for example, Rubin 1996).

This technical paper describes the income imputation methodology used in NSOC I, II and III. These values were included in the enhanced data NSOC files released in 2020.

Extent of Missing Data for Total Income

Table 1 shows the extent and type of missing data for each round. After bringing over information on spouse caregivers' income from NHATS (either reported or imputed), exact values are available for 71%-77% of NSOC respondents. About 5% - 10% of caregivers reported categorical values for their income, and about 17% - 19% of NSOC respondents have no income information, including 2%-3% that reported zero income in a given round.

Table 1. Percentages of respondents who reported income questions or have missing income.

	NSOC I	NSOC II	NSOC III Cross-sectional	NSOC III Longitudinal
% with reported income in NSOC or reported or imputed income in NHATS	71.2	77.1	71.6	72.1
% reported income category	9.5	5.2	7.5	6.8
% missing income value and category*	19.3	17.7	19.4	16.9
% did not help last month or in last month of life**	-	-	1.5	4.2
Total n	2,007	2,204	2,652	1,453

* In NSOC and NHATS, a small proportion of cases (2%-3%) reported their income as 0. We believe the majority of these cases are refusals/don't knows; we therefore impute income for these cases.

**In NSOC III, respondents who did not help last month or in the last month of life skipped the income questions. These cases are not imputed and are set to -4. The numbers for the remaining cases are 2612 (NSOC III cross-sectional) and 1392 (NSOC III longitudinal).

Imputation Approach

Each round, log income was imputed five times (and then transformed back to income). For respondents who provided no income values (or in rare cases a value of 0), we used multiple imputation by chained equations (MICE) to impute missing income and missing covariates. We used interval regression to impute income, which fills in the missing values of partially observed (censored) income. For all three rounds, we ran separate models for three groups: non-spouse/partner, non-breakoffs; spouse/partners; and breakoffs (who have fewer covariates available). For Round 7, we also imputed income for a fourth group: caregivers to deceased NHATS Sample Persons. We used Stata for all analyses.

Data Preparation for Imputation

Prior to estimating the imputations, we prepared the samples to be used to estimate the imputation models as follows:

Step 1. For spouses/partners of living NHATS Sample Persons whose income was not asked in NSOC, we used their income reported or imputed in NHATS to fill in the missing (i.e., “-1 Inapplicable”) information in NSOC:

- Among these respondents, if their income was reported in NHATS, their reported income (ia#totinc, where # = round number) was used to fill in the missing in NSOC.
- Among these respondents, if their income was imputed in NHATS, the average of the five imputed income variables in NHATS (ia#toincim1- ia#toincim5) was used to fill in the missing information in NSOC¹.

We examined the distributions of income (reported or imputed) of spouse/partner caregivers and identified three respondents with very high income imputed in NHATS. Given that income of these three respondents are extreme outliers in the NSOC income distribution, we decided to re-impute income for these three respondents in NSOC. A small number of spouse/partner caregivers who reported zero income in NHATS also were imputed.

Step 2. We generated the upper and lower income limit variables as follows:

- For respondents with exact income values (reported in NSOC or for spouse caregivers reported or imputed in NHATS), the income value is specified as both lower and upper limits, indicating that these responses are definite and do not need imputation.

¹ To capture the effects of imputation for spouses/partners of SP whose income were imputed in NHATS, one could also use the five sets of imputed values from NHATS to impute the five sets of imputed values in NSOC. Given the small number of missing cases among spouses/partners of SP, statistics of the imputed variables for the two approaches did not vary much.

- For respondents with categorical information, their brackets (that is, lower and upper values) are used as their income limits. Those with only an upper limit (e.g., income < \$10,800) received zero as their lower limit. Those with only a lower limit (e.g., income > \$10,800) received a missing value for their upper limit, which can take any positive value.
- For other respondents being imputed (missing income, reports of zero income, spouse/partner outliers), their lower limit was specified as 0, and an upper limit was set as missing, which can take any positive number.

Step 3. We then log transformed the upper and lower income limit variables. Prior to transformation, we added one to the limit variables.

Variables Used in Imputation

Table 3 below indicates covariates included in imputation for each subgroup. All missing values were imputed using the imputed chain procedure, beginning with the least missing. Variables were included as follows:

- For all groups, models include: caregiver's characteristics (e.g., age, gender, education, race / ethnicity, number of other people in the household, spouse/partner's education) and geographic indicators of the NHATS Sample Person (census division and metro / non-metro residence).
- For all groups except spouse/partner caregivers we also include: relationship of caregiver to sample person, sample person's income from NHATS and whether the caregiver lives with the SP in the current round (the latter is omitted for the R7 longitudinal LML sample because it is not available for all as of R7).
- For all groups except breakoffs we also include: insurance coverage (private insurance, Medicaid enrollment) and assets (e.g., whether the CG and their spouse/partner have a checking account, savings account, certificate of deposit, retirement plan, and stocks or mutual funds).
- For non-break off caregivers to living SPs we also include employment variables (own business/farm and work for pay last week).
- Finally, for the R7 NSOC longitudinal sample only, income from R5 NSOC was included.

Table 3. Covariates used to impute income in NSOC for each subgroup.

Note: Non-S: non-spouses/partners of SP; S: spouses/partners of SP; BF: breakoff respondents; LML: caregivers to deceased SPs.

Income Imputation Process

We created multiple imputations by chained equations (MICE) to impute missing covariates and income. Interval regression was used to impute income. We incorporated the NSOC survey design as follows (Reiter 2006). NSOC weights were included in the imputation model (using a pweight statement). To account for strata and cluster variables in imputation, we included variables for the SP's census division and a metro / non-metro residence indicator in the model.²

In each imputation, we specified 20 burn-in iterations (i.e., the number of iterations before the first set of imputed values is drawn). The steps for conducting the imputation are summarized below in two steps:

- Step 1. Impute missing covariates and income using MICE sequentially for each subgroup. The order of imputation is consistent with the column order specified in Table 3 (e.g., for NSOC I, non-spouses/partners of SP were imputed first, then spouses/partners, and finally breakoff respondents). For NSOC III, we imputed the cross-sectional samples before the longitudinal samples. Imputed values for income for earlier groups were averaged and used in subsequent models estimated for later groups; remaining values were independently imputed five times.
- Step 2. Transform income values back to a dollar scale. Final imputed variables were constructed with either reported values repeated five times or the five distinct imputed income values (from either NSOC or NHATS). Flags were created to indicate which values were imputed.

Imputation model results for income can be found in the appendix.

² We considered other approaches – e.g. adding a variable for each strata by cluster combination or imputing separately by each unique cluster (Heeringa, West & Berglund, 2017). However, the NHATS' complex sample design has too many cluster/strata combinations to implement these approaches (56 strata and two clusters per stratum).

Income Imputation Variables in NSOC

The following imputed variables are included in each round of NSOC.

Table 4. Imputed variables included in NSOC

Variable name	Label	Description
<i>NSOC I: 2010 Total Income Value</i>		
chi1income	C1 HI10 INCOME LAST YEAR	Actual reported \$ amount
chi1incimf	C1 F IMPUTED INCOME LAST YEAR FLG	Flag indicating imputation
chi1incim1-chi1incim5	C1 HI10 IMPUTED INCOME LAST YEAR INC1-INC5	Includes reported \$ amount, imputed values 1-5 for missing \$ amounts and reported bracket amounts
<i>NSOC II: 2014 Total Income Value</i>		
chi5income	C5 HI10 INCOME LAST YEAR	Actual reported \$ amount
chi5incimf	C5 F IMPUTED INCOME LAST YEAR FLG	Flag indicating imputation
chi5incim1-chi5incim5	C5 HI10 IMPUTED INCOME LAST YEAR INC1-INC5	Includes reported \$ amount, imputed values 1-5 for missing \$ amounts and reported bracket amounts
<i>NSOC III Cross-sectional sample: 2016 Total Income Value</i>		
chi7income	C7 HI10 INCOME LAST YEAR	Actual reported \$ amount
chi7incimf	C7 F IMPUTED INCOME LAST YEAR FLG	Flag indicating imputation
chi7incim1-chi7incim5	C7 HI10 IMPUTED INCOME LAST YEAR INC1-INC5	Includes reported \$ amount, imputed values 1-5 for missing \$ amounts and reported bracket amounts
<i>NSOC III Longitudinal sample: 2016 Total Income Value</i>		
lchi7income	C7 HI10 INCOME LAST YEAR	Actual reported \$ amount
lchi7incimf	C7 F IMPUTED INCOME LAST YEAR FLG	Flag indicating imputation
lchi7incim1-lchi7incim5	C7 HI10 IMPUTED INCOME LAST YEAR INC1-INC5	Includes reported \$ amount, imputed values 1-5 for missing \$ amounts and reported bracket amounts

Descriptive Statistics for Income

Table 5 presents the weighted mean and median values for income by imputation category (as indicated by chi#incimf or Ichi#incimf) and for all groups combined. Means and medians for “Imputed in NSOC”, “Imputed in NHATS” and “All groups combined” are computed based on averages of the five imputed variables.

Table 5. Weighted mean and median income by NSOC round

	Round 1			Round 5			Round 7 cross-sectional ^{1,2}			Round 7 longitudinal ¹		
	n	Mean	Median	n	Mean	Median	n	Mean	Median	n	Mean	Median
Reported in NSOC	1,014	57,740	45,000	1,231	61,999	47,000	1,228	69,913	50,000	772	55,580	40,000
Reported in NHATS	252	50,675	36,000	281	62,618	40,000	298	94,033	55,000	180	65,640	55,000
Imputed in NSOC	579	54,907	31,693	505	56,361	37,221	621	64,572	41,897	348	62,465	41,207
Imputed in NHATS	162	45,920	33,800	187	56,467	36,800	177	91,519	54,000	92	56,005	46,600
All groups	2,007	55,132	40,000	2,204	60,373	42,000	2,324	73,514	50,000	1,392	58,461	42,000

¹ Excludes those who did not help last month or in the last month of life.

² To facilitate comparisons with Rounds 1 and 5, caregivers who helped deceased SP during their last month of life (n=288) are excluded from the Round 7 cross-sectional estimates.

As shown in Table 5, the Round 7 cross-sectional sample has a higher mean and median income than Round 1 or 5. This difference appears to be driven by higher reported and imputed income for spouse/partner caregivers whose values come from Round 7 NHATS. These higher values are consistent with the observation that caregiving spouse/partners have higher completed education levels in Round 7 than in earlier rounds.

Using the Five Versions of Income in Analyses

For each round, five sets of imputed variables were generated.

To adjust coefficients and standard errors for the variability between imputations following the combination rules by Rubin (1987), users can use the “mi estimate” command in Stata to run estimations on the imputed dataset.

Below is some example code to estimate unweighted and weighted mean income using NSOC I.

```
*generate a reported income variable which includes only reported income values from either NHATS or  
NSOC  
gen chi1incim = chi1incim1  
replace chi1incim = . if chi1incimf == 3  
replace chi1incim = . if chi1incimf == 4  
  
*save it to a new dataset  
save newdataset, replace  
  
*use this new dataset for analysis  
use newdataset, clear  
  
*use mi import to import data that include reported income and additional imputed income variables  
mi import wide, imputed (chi1incim=chi1incim1 chi1incim2 chi1incim3 chi1incim4 chi1incim5) drop  
mi set wide  
*estimate unweighted mean income of NSOC I  
mi estimate: mean chi1incim  
  
*estimate weighted mean income of NSOC I  
recode c1varstrat (54=55)3  
mi svyset c1varunit [pweight=w1cgfinwgt0], strata(c1varstrat)  
mi estimate: svy: mean chi1incim
```

³ For NSOC I only, users should first recode c1varstrat=54 to c1varstrat=55 because c1varstrat=54 has no cases in cluster 1.
